

## Pundit, a semantic annotation tool for researchers

**Contact:** Lieke Ploeger

Pundit is an open source tool for semantic enrichment. It has been designed by the Italian software company [Net7](#) as part of the [DM2E Project](#), which is focused on building tools and communities that enable humanities researchers to work with manuscripts in the Linked Open Web, as well as within European projects mainly focused on Digital Humanities (SEMLIB - Semantic Digital Libraries, AGORA, ERC AdG 2011 Lookingatwords, ERC AdG 2009 EUROCORA) and thus used primarily in the Humanities domain.

The session aims at illustrating Pundit main features and components (the client, feed, ask) as well as showing how it has been used by specific scholarly communities in Philosophy, History of Art, Philology and History of Thought domains.

Moreover, attendees will be practically introduced to Pundit through dedicated exercises thought to give them the first skills to produce semantic annotations on Digital Libraries and generic websites.

**Further information:** <http://dm2e.eu/digital-humanities/>

**Ideal length of the session:** 2 hours

**Ideal number of participants:** No more than 20

**Any technical requirements:** Projector, personal laptops, Internet connection
